Building a house will cost you anywhere from 150-500 a foot, depending on size, labor, location and materials you choose. So if you are building a 2200 sq ft two storey, with and unfinished basement, and you already own the lot, expect to pay anywhere from 300K to 1Million to build it from start to finish. 150-350 is a big difference you ask, and you would be right. But you wanted something quick, didn't you? So, if you are building a base model, nothing special or super fancy, new, and well built home, you will be safe to estimate \$150 a square foot. 300 a square foot? Your getting into the nicer show homes that the track builders build. They will have the butlers pantry, the ship lap feature, nice garage doors, etc. Here you can be in a custom cabinetry and quartz territory. \$500 a square foot on the other hand, is where you want custom everything. High end finishes, high quality, and typically things in the house you wouldn't find in a standard home like secret rooms, an elevator, or a copious amount of important finishes that you just have to have. Take into consideration that I typically build and sell my homes from \$500+/sqft, there are many factors that come into play that often bring people up above that range. So there are so many differing factors affecting home building prices, that it's impossible to have a one size fits all that works everywhere. Instead, there are some important factors that you need to consider if you want to dive deeper and get a clearer view of estimating you build. These factors are: Location, Size, Labor, Material Location: A hot market is exactly that. Things cost more. Its more expensive to build, its more expensive to buy, and its more expensive to hire builders. If you are in a hot market, you have to realize that your labor costs, lot costs, and even material costs might increase substantially. For an easy example, think about the difference in building cost in a home in Orange County California, vs in Saskatoon, Saskatchewan. A 3000 sq ft two storey home might go for 600K in Saskatoon vs. 6 million in orange county. Size. Building a smaller home will generally mean it will be cheaper. But remember that you will always have a base price to simply get them onsite. Also, building bigger might mean more complex construction, uncommon material and specialized labor. Labor: You should know that builders are NOT all the same. Anyone builder can build you a house, but not everyone can build you a well built house. Also, if there is a labor shortage, be prepared to pay a premium to get your project moved up to the head of the line. Material: They say that 80% of the home is invariable. meaning, the cost is pretty much the cost. The same 2x4 costs the same in an average house, as an luxury home, and the same concrete used costs the same as well. Where the biggest jump comes is in the finishing costs. That 20% of variable costs can mean the difference between a 900K build and a 1.2 million dollar build.

Building Cost + How It Impacts Design (An Architect's Guide) | Architecture Short Course (Part 3)

Building cost has a direct impact on our design and it's one of the most basic and obvious concerns for architects and clients. In this video I'll show you how I use it as a creative constraint that informs our building design. Building cost is divided into two general categories: soft and hard costs. Soft costs are the indirect cost of design: architectural fees, consultant fees, permitting, financing, and legal fees. Hard costs are all the cost directly attributed to the construction of the physical building. Early on in the design process we know little about the building and so we use square footage as a means for estimating the building's cost to construct. But square footage alone won't provide all the information we need to properly describe the cost of a structure, some spaces cost more to build than others. Factoring the square footage provides an added level of precision and allows clients and architects to better plan how design affects the overall budget. Planning for unforeseeable conditions is important as well and I describe how much of a contingency to add to the project at each phase of the work. Cost considerations are crucial to realizing both our client's project and our vision for the work in the world and this video shares the framework I use to get there. // GEAR I USE // DSLR CAMERA: * Canon 70D: amzn.to/29klz7k LENSES: * Canon 24mm f2.8 Lens: amzn.to/29i7ac5 * Canon 40mm f2.8 Lens: amzn.to/29x2QcI AUDIO: * Rode VideoMic Pro (hotshoe mtd.): amzn.to/29qINM3 * ATR-2100 USB (dynamic mic): amzn.to/2dFDaKp ARCHITECTURE GEAR: * Prismacolor Markers: thirtybyforty.com/markers * Timelapse Camera: thirtybyforty.com/brinno * AutoCAD LT: amzn.to/2dxjMDH * SketchUp PRO: amzn.to/2cRcojz * HP T120 Plotter: amzn.to/2dBGf1O * Adobe CC Photography (Photoshop/Lightroom) Plan: amzn.to/2dhq5ap STARTUP TOOLKIT: * Architect + Entrepreneur Startup Toolkit: thirtybyforty.com/SPL ~~~~~ Please watch: "Making a Site Model - The Outpost Project" youtube.com/watch?v=VsJrDScS5ZI ~~~~~
