### How to Figure the Cost of Replacing a Water Heater

How to Figure the Cost of Replacing a Water Heater. Part of the series: Water Heaters. When it comes to replacing your hot water heater, the main expense is the heater itself. Figure the cost of replacing a water heater with help from a Foreman for Lighty Contractors in this free video clip.

### How much does it cost to replace a water heater

When you are buying a house one of the things to always look at and that is how old is the water heater, there is a small tag on the water heater that will tell you when it was installed, you basically want a water heater that is less than 10 years old. If it is older than it would be a good idea to replace it. Generally it cost \$800 to \$1,500 to replace a water heater which is not such a huge deal but its good to always have a good working water heater because well it heats your water. ### How to choose a Hot Water Heater - Costs & Warranty

► Costs to Install / Replace a Water Heater: [remodelingcalculator.org/costs-install-hot-water-heater/](http://remodelingcalculator.org/costs-install-hot-water-heater/) ► Water Heater Calculator: [remodelingcalculator.org/water-heater-calculator/](http://remodelingcalculator.org/water-heater-calculator/) ► Tankless Water Heater Calculator: [remodelingcalculator.org/tankless-water-heater-cost-calculator/](http://remodelingcalculator.org/tankless-water-heater-cost-calculator/) ► Learn which water heater you should get - 6, 9 or 12 years warranty, Home Depot brand or from Plumbing Supply, etc. Water heaters are NOT expensive, but you should still do some research before going to home depot/lowe's and buying the cheapest or most expensive unit they have. There are certain things you need to know before choosing your water heater. Here we will just talk about TANK water heaters, leaving TANKLESS for another video. First, I recommend that you get the longest warranty period possible. Each step will cost you about \$100. Warranties for Home Improvement stores go in 3 year increments, starting with 6. For example - a 6 year, 40 gallon gas water heater will cost about \$400. A 9 year 40 gallon will cost \$500 and a 12 year will be about \$580. So you may think - 50% (\$180-200) difference in upfront cost between 6 and 12 years, but also consider that at year 6, when you need to replace the cheap unit, you will also have to shell out \$700 for replacement labor. Also cost per year is \$67 for a 6 year unit and \$50 for a 12 year unit. In addition, a 12 year unit is more energy efficient, so you will save additional money on gas (or electricity). Now if you will definitely move within 5-6 years, then maybe you should go for a cheaper model. [remodelingcalculator.org/](http://remodelingcalculator.org/)

### Common Water Heater Myths Answered | Ask This Old House

Ask This Old House plumbing and heating expert Richard Trethewey shares some advice on maintaining water heaters  
SUBSCRIBE to This Old House: [bit.ly/SubscribeThisOldHouse](http://bit.ly/SubscribeThisOldHouse) Richard explains that most tank-type water heaters last for about 8-12 years. However, by changing the anode rod every 2 years, you can make the hot water tank last for as long as 30 years. The rods can be found at home centers. Cost: \$10 and up Skill Level: Beginner Shopping List: Anode rod Steps: 1. Look for a rating plate on the water heater that will tell when the tank was manufactured and the warranty life. Tanks that have reached the end of their warranty period are more likely to fail. 2. If you're planning to change to a different style water heater, like going from a tank-style to a tankless, its better to change proactively. 3. Water heaters placement will also help determine when it should be replaced. A water heater in the living area or a finished basement could do more damage if it floods than one in an unfinished basement. 4. By proactively changing the anode rod in a tank style water heater every few years, a tank can be kept in service for many years. If the anode rod isn't changed in the first few years of the water heater's life, it may be impossible to remove later. 5. Periodically drain the water heater by attaching a hose to the draw off at the bottom of the tank, turn the water supply off, and then turn the water supply off and on a few times quickly. 6. If you notice a leak on the floor, turn off the water supply, attach a hose to the draw off, and drain the tank below the level of the leak. Call a plumber to replace the water heater. FOLLOW US ON INSTAGRAM: [instagram.com/thehonestcarpenter](http://instagram.com/thehonestcarpenter) FOLLOW US ON LINKEDIN: [linkedin.com/in/thehonestcarpenter](http://linkedin.com/in/thehonestcarpenter) Tankless Water Heater VS. Conventional Water Heater (PROS + CONS / COST ANALYSIS - WHICH IS BETTER?) CONVENTIONAL / STANDARD / TANK WATER HEATERS: PROS -- Cheaper for initial install, approx. \$1600. Will last 8-12 years with limited maintenance (which tends to also be cheaper). Many gas units will continue to operate even when power is out. CONS -- Will run out of hot water during heavy usage. Can take up to 45 minutes to reheat tank. Are prone to catastrophic failures, which can result in flooding damage. TANKLESS WATER HEATERS: PROS -- Can supply a constant stream of hot water. Units like the Navien 240-A in this video can supply three showers with hot water simultaneously. Will last up to 20+ years with routine maintenance. Have high energy ratings. Can easily be fixed by a licensed plumber thanks to diagnostic computers and replaceable parts. Are less prone to catastrophic failure. Add value to a home. CONS -- More expensive to install, approx. \$4400. Must be kept on an annual maintenance plan. Will not operate during a power outage (unless a backup water heater power supply is installed). THINGS TO KEEP IN MIND: --Both units can benefit from an inline water filtration system. These units keep minerals out of the water supply before they reach the water heater. This prolongs the lifespan of both units, and improves your water quality as well. --Tankless water heaters do have great energy ratings, and can conserve both gas and electricity, but only if homeowners do not INCREASE their water usage after installation.
